

# Data Representation

## Lecture 2

# A little Bit of Mathematics

- Since young, we been learn to write numbers as

1 2 3 4 5 6 7 8 9 0

- The actual way to write them is

1<sub>10</sub> 2<sub>10</sub> 3<sub>10</sub> 4<sub>10</sub> 5<sub>10</sub> 6<sub>10</sub> 7<sub>10</sub> 8<sub>10</sub> 9<sub>10</sub> 0<sub>10</sub>

# A little Bit of Mathematics

1<sub>10</sub> 2<sub>10</sub> 3<sub>10</sub> 4<sub>10</sub> 5<sub>10</sub> 6<sub>10</sub> 7<sub>10</sub> 8<sub>10</sub> 9<sub>10</sub> 0<sub>10</sub>

- The “10” is called the **base** or **radix**
- Likely motivated by counting with ten fingers
- We call the system of base 10, **decimal system**

# A little Bit of Mathematics

- Other bases had been used in the past
- Babylonian system uses base **60**

|    |           |    |            |    |             |    |              |    |               |    |                |
|----|-----------|----|------------|----|-------------|----|--------------|----|---------------|----|----------------|
| 1  | 𐎶         | 11 | 𐎵𐎶         | 21 | 𐎵𐎵𐎶         | 31 | 𐎵𐎵𐎵𐎶         | 41 | 𐎵𐎵𐎵𐎶𐎶         | 51 | 𐎵𐎵𐎵𐎶𐎶𐎶         |
| 2  | 𐎶𐎶        | 12 | 𐎵𐎶𐎶        | 22 | 𐎵𐎵𐎶𐎶        | 32 | 𐎵𐎵𐎵𐎶𐎶        | 42 | 𐎵𐎵𐎵𐎶𐎶𐎶        | 52 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶        |
| 3  | 𐎶𐎶𐎶       | 13 | 𐎵𐎶𐎶𐎶       | 23 | 𐎵𐎵𐎶𐎶𐎶       | 33 | 𐎵𐎵𐎵𐎶𐎶𐎶       | 43 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶       | 53 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶       |
| 4  | 𐎶𐎶𐎶𐎶      | 14 | 𐎵𐎶𐎶𐎶𐎶      | 24 | 𐎵𐎵𐎶𐎶𐎶𐎶      | 34 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶      | 44 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶      | 54 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶      |
| 5  | 𐎶𐎶𐎶𐎶𐎶     | 15 | 𐎵𐎶𐎶𐎶𐎶𐎶     | 25 | 𐎵𐎵𐎶𐎶𐎶𐎶𐎶     | 35 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶     | 45 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶     | 55 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶     |
| 6  | 𐎶𐎶𐎶𐎶𐎶𐎶    | 16 | 𐎵𐎶𐎶𐎶𐎶𐎶𐎶    | 26 | 𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶    | 36 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶    | 46 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶    | 56 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶    |
| 7  | 𐎶𐎶𐎶𐎶𐎶𐎶𐎶   | 17 | 𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶   | 27 | 𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶   | 37 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶   | 47 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶   | 57 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶   |
| 8  | 𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  | 18 | 𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  | 28 | 𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  | 38 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  | 48 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  | 58 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶  |
| 9  | 𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 | 19 | 𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 | 29 | 𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 | 39 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 | 49 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 | 59 | 𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶𐎶 |
| 10 | 𐎶         | 20 | 𐎵𐎵         | 30 | 𐎵𐎵𐎵         | 40 | 𐎵𐎵𐎵𐎵         | 50 | 𐎵𐎵𐎵𐎵𐎵         |    |                |

$56 = \text{𐎵𐎵𐎵𐎶𐎶𐎶𐎶𐎶}$   
 $84 = \text{𐎶𐎵𐎵𐎶𐎶𐎶𐎶𐎶𐎶}$

# Data Representation

- In Computers, we use 4 different base numbers for our work
  - Decimal System
  - Binary System
  - Octal System
  - Hexadecimal System

# **Decimal System**

## **Lecture 3**

### **Data Representation**

# Decimal System

- Also called **base 10** and **Denary**
- Numerical base most widely used by modern civilization
- **Positional notation system** for representing numbers
  - Representation consists of a string of digits

# Decimal System

- Each digit increases in numeric weight by **10** from right to left
- Example

Decimal Number 327, positional notation is:

$$327 = (3 \times 10^2) + (2 \times 10^1) + (7 \times 10^0)$$

weight value for the right-most digit

Hundred (100)    ten (10)    unit (1)

# Decimal System

- What is the positional notation of decimal number 1234?

Positional Notation is

$$1234 = 1 \times 10^3 + 2 \times 10^2 + 3 \times 10^1 + 4 \times 10^0$$

# **Binary System**

## **Lecture 3**

### **Data Representation**

# Binary System

- How is data stored on hard disk?
- Data in computers are represented by **0 and 1**
- Hence the name **binary**, base **2**

# Binary System

- Each binary digit is called a **bit**
  - **Binary Digit**
- **Byte** is a string (i.e. a set / group ) of **8 bits**
- In mathematics, using International System of Units (SI)
  - 1000 = kilo, k
  - 1 kb = ?

# Binary System

- 1kb = 1000 bytes by definition using SI units
- However in Computer Science, we are always based on multiple of 2
  - Hence 1kb = 1024 bytes ( $2^{10}$ )
- But for storage devices, most hardware manufacturers use 1kb = 1000 bytes.
  - That's why they appear smaller in size when we use them

# Binary System

- What is the positional notation of binary number 101?
- Notice the difference between decimal
  - 10 is replaced by 2

Binary Number 101 positional notation is:

$$101 = (1 \times 2^2) + (0 \times 2^1) + (1 \times 2^0)$$

$\underbrace{\hspace{1cm}} \quad \underbrace{\hspace{1cm}} \quad \underbrace{\hspace{1cm}}$   
(4)            (2)            (1)

← weight value

# MSB & LSB

- About MSB & LSB
- Stands for Most Significant Bit & Least Significant Bit
  - A way to tell which is front which is back
  - Important for a computer to know this
  - Leads to Endianness

MSB

LSB

**10001010101**

# Endian

- The ordering of bytes

- 2 key forms : Big-Endian & Little-Endian
- Will be elaborated on later in the course. For now, just keep this in mind
- Know that today's computers are generally either big or little endian

# Hexadecimal System

## Lecture 3 Data Representation

# Hexadecimal System

- Radix of **16**
- Widely used for computer systems
  - Useful and convenient external representation for internal contents

# Hexadecimal System

- What happens after F?
  - $16_{10} = 10_{16}$

## Hexadecimal System

| Hex | Dec | Binary |
|-----|-----|--------|
| 0   | 0   | 0000   |
| 1   | 1   | 0001   |
| 2   | 2   | 0010   |
| 3   | 3   | 0011   |

| Hex | Dec | Binary |
|-----|-----|--------|
| 4   | 4   | 0100   |
| 5   | 5   | 0101   |
| 6   | 6   | 0110   |
| 7   | 7   | 0111   |

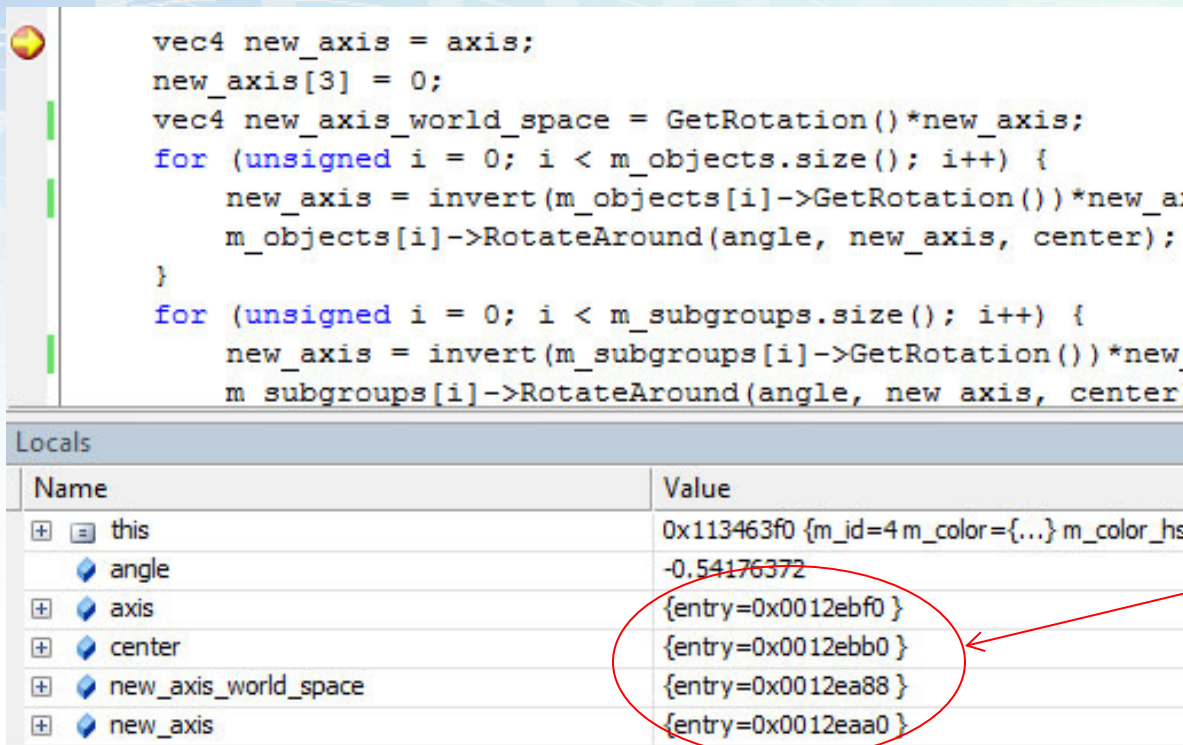

| Hex | Dec | Binary |
|-----|-----|--------|
| 8   | 8   | 1000   |
| 9   | 9   | 1001   |
| A   | 10  | 1010   |
| B   | 11  | 1011   |

| Hex | Dec | Binary |
|-----|-----|--------|
| C   | 12  | 1100   |
| D   | 13  | 1101   |
| E   | 14  | 1110   |
| F   | 15  | 1111   |

# Usage of Hexadecimal

- Understanding Hexadecimal is very useful in Visual Studio

```
vec4 new_axis = axis;
new_axis[3] = 0;
vec4 new_axis_world_space = GetRotation()*new_axis;
for (unsigned i = 0; i < m_objects.size(); i++) {
    new_axis = invert(m_objects[i]->GetRotation())*new_axis;
    m_objects[i]->RotateAround(angle, new_axis, center);
}
for (unsigned i = 0; i < m_subgroups.size(); i++) {
    new_axis = invert(m_subgroups[i]->GetRotation())*new_axis;
    m_subgroups[i]->RotateAround(angle, new_axis, center);
}
```

| Name | Value                |   |
|------|----------------------|---|
| +    | this                 | 0x113463f0 {m_id=4 m_color={...} m_color_hs |
| +    | angle                | -0.54176372                                 |
| +    | axis                 | {entry=0x0012ebf0 }                         |
| +    | center               | {entry=0x0012ebb0 }                         |
| +    | new_axis_world_space | {entry=0x0012ea88 }                         |
| +    | new_axis             | {entry=0x0012eaa0 }                         |

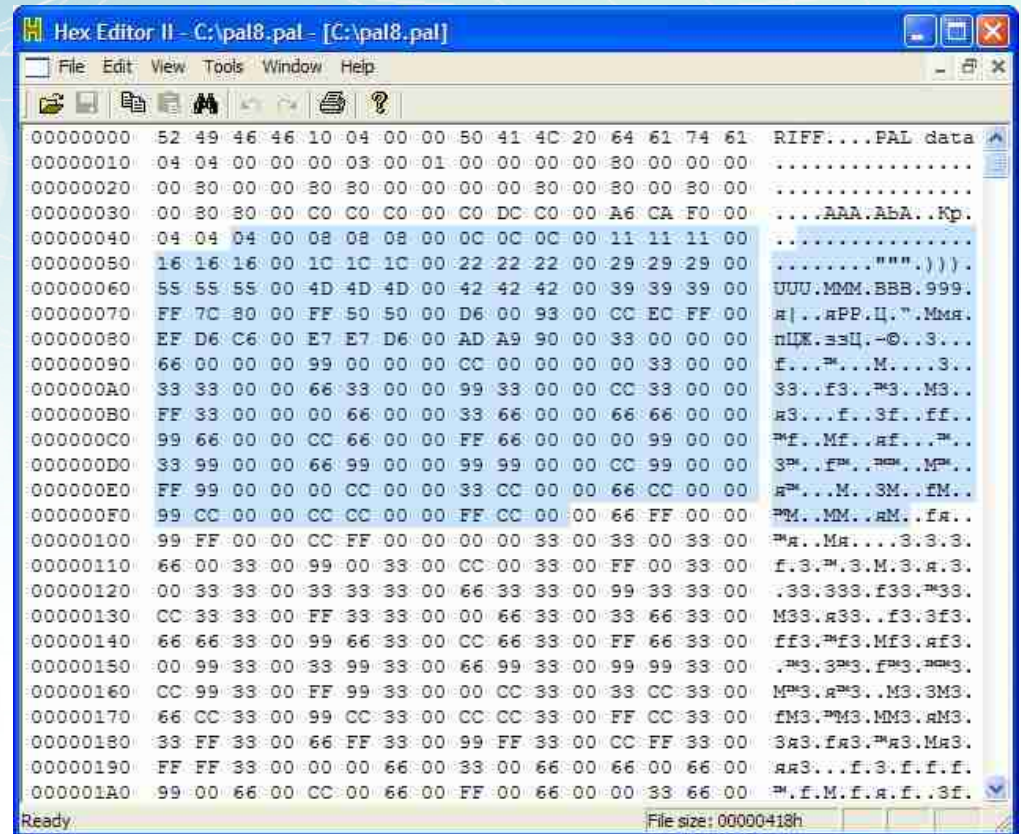

Many values listed are in hex (numbers starting with 0x)

# Why Hexadecimal is Important for You

- In old school days, this is how we 'edit' savegames to cheat 😊
- Again, using hexadecimal!

# **Octal Numeral System**

## **Lecture 3**

### **Data Representation**

# Octal

- Radix of **8**
- Used most often in Unix for file permission
  - read up on chmod command in Unix
- Advantage over hexadecimal is that it does not require extra symbols as digits
- Originally widely used in computing for digital displays
  - Binary display were too complex
  - Decimal requires complex hardware to convert radices
  - Hexadecimal requires more numerals

# Prefix

- In C Programming
  - Octal Numeral System
    - 0o
  - Hexadecimal
    - 0x

# **Conversion of Bases**

## **Lecture 3**

### **Data Representation**

# Conversion of Bases

- First Step:
  - Convert the number to decimal first
  - It's hard to visualize numbers in other bases due to our past education and normal usage

# Formula

- To convert any number from the base **n**,

say  **$M_{k-1}M_{k-2}M_{k-3}...M_0$** <sub>(n)</sub>

(e.g binary **1111** where there are 4 characters in the string hence

$$k = 4 \text{ and } n = 2$$

- Decimal =  **$M_{k-1} \times n^{k-1} + M_{k-2} \times n^{k-2} + \dots + M_1 \times n^1 + M_0 \times n^0$**

(e.g  **$1 \times 2^3 + 1 \times 2^2 + 1 \times 2^1 + 1 \times 2^0 = 15$** )

# Conversion of Bases

- Second Step:
  - **Divide** the number by the **base** you wish to convert to
  - The **remainder** will be the value to put at the left side of the answer
- **Repeat** 2<sup>nd</sup> step till the result from division is 0.

# Conversion of Bases

- Example: Convert 2012 to hex

| Step | Num         | Result     | Remainder | Hex        |
|------|-------------|------------|-----------|------------|
| 0    | <b>2012</b> | <b>125</b> | <b>12</b> | <b>C</b>   |
| 1    | <b>125</b>  | <b>7</b>   | <b>13</b> | <b>DC</b>  |
| 2    | <b>7</b>    | <b>0</b>   | <b>7</b>  | <b>7DC</b> |

Hence result is **7DC**<sub>16</sub>

# Conversion of Bases

- Let's convert it back to decimal

$$\begin{aligned}7DC_{16} &= 7_{16} \times 16_{10}^2 + D_{16} \times 16_{10}^1 + C_{16} \times 16_{10}^0 \\&= 7_{10} \times 16_{10}^2 + 13_{10} \times 16_{10}^1 + 12_{10} \times 16_{10}^0 \\&= 7_{10} \times 256_{10} + 13_{10} \times 16_{10} + 12_{10} \times 1_{10} \\&= 1792_{10} + 208_{10} + 12_{10} \\&= 2012_{10}\end{aligned}$$

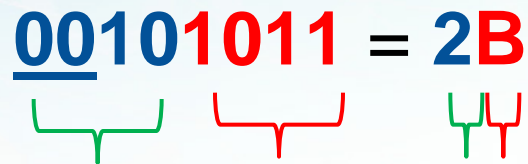

# Conversion of Bases

- Shortcut!
- For our industry, binary and hexadecimal is very common
- We can do direct conversion easily without much effort
  - Because  $16 = 2^4$

# Conversion of Bases

- We can think of
  - 4 bits convert to 1 hex digit
- For example

$$\underline{0010}1011 = 2B$$

# **Character Representation**

## **Lecture 3**

### **Data Representation**

# Character Representation

- A typical 'string' of characters expressed in a form usable by a computer

|   |   |   |   |   |   |    |
|---|---|---|---|---|---|----|
| h | e | l | l | o | ! | \0 |
|---|---|---|---|---|---|----|

- Computer doesn't store each character as itself  
i.e.  $h = h$  (This is meaningless to a computer)
- Instead a table is used to map the meaning of character to a number that computer understands  
i.e. ASCII Table

# ASCII

| Dec | Hx | Oct | Char                               | Dec | Hx | Oct | Html  | Chr          | Dec | Hx | Oct | Html  | Chr      | Dec | Hx | Oct | Html   | Chr        |
|-----|----|-----|------------------------------------|-----|----|-----|-------|--------------|-----|----|-----|-------|----------|-----|----|-----|--------|------------|
| 0   | 0  | 000 | <b>NUL</b> (null)                  | 32  | 20 | 040 | &#32; | <b>Space</b> | 64  | 40 | 100 | &#64; | <b>@</b> | 96  | 60 | 140 | &#96;  | <b>`</b>   |
| 1   | 1  | 001 | <b>SOH</b> (start of heading)      | 33  | 21 | 041 | &#33; | <b>!</b>     | 65  | 41 | 101 | &#65; | <b>A</b> | 97  | 61 | 141 | &#97;  | <b>a</b>   |
| 2   | 2  | 002 | <b>STX</b> (start of text)         | 34  | 22 | 042 | &#34; | <b>"</b>     | 66  | 42 | 102 | &#66; | <b>B</b> | 98  | 62 | 142 | &#98;  | <b>b</b>   |
| 3   | 3  | 003 | <b>ETX</b> (end of text)           | 35  | 23 | 043 | &#35; | <b>#</b>     | 67  | 43 | 103 | &#67; | <b>C</b> | 99  | 63 | 143 | &#99;  | <b>c</b>   |
| 4   | 4  | 004 | <b>EOT</b> (end of transmission)   | 36  | 24 | 044 | &#36; | <b>\$</b>    | 68  | 44 | 104 | &#68; | <b>D</b> | 100 | 64 | 144 | &#100; | <b>d</b>   |
| 5   | 5  | 005 | <b>ENQ</b> (enquiry)               | 37  | 25 | 045 | &#37; | <b>%</b>     | 69  | 45 | 105 | &#69; | <b>E</b> | 101 | 65 | 145 | &#101; | <b>e</b>   |
| 6   | 6  | 006 | <b>ACK</b> (acknowledge)           | 38  | 26 | 046 | &#38; | <b>&amp;</b> | 70  | 46 | 106 | &#70; | <b>F</b> | 102 | 66 | 146 | &#102; | <b>f</b>   |

# Character Set / Character Encoding

- The ASCII Table is a good example of a character set
- Each character mapped to a number
- Number can be expressed as decimal, binary, hexadecimal
- Limitations:
  - ASCII limited to 128 characters
  - Can't express complex character languages on computers e.g. 日本語

# UNICODE

- Created to support a wider set of character representation
- Uses multiple bytes to describe a character
  - Versus ASCII which uses 1 byte per character
- A number of different encodings exist
  - UTF-1, UTF-7, **UTF-8**, UTF-EBCDIC, **UTF-16**, UTF-32

Most commonly used today

# UTF-8

- Uses 1 to 4 bytes to represent a character
- Variable (can be 1-4 bytes)
  - Uses encoding to store in a variable way
- ASCII-compatible

# UTF-8

| Unicode            | Byte-1           | Byte-2           | Byte-3           | Byte-4           | Example  |
|--------------------|------------------|------------------|------------------|------------------|--|
| U+0000 – U+007F    | <b>0</b> xxxxxxx |                  |                  |                  | U+0067 (103)<br>Binary : 0 <b>110</b> 0 <b>111</b><br><br>Encoded: 0 <b>1100111</b>  |
| U+0080 – U+07FF    | <b>110</b> yyyxx | <b>10</b> xxxxxx |                  |                  | U+05AA (1450)<br>Binary : 0 <b>101</b> <b>1010</b> <b>1010</b><br><br>Encoded: [ <b>11010110</b> ] [ <b>10101010</b> ]   |
| U+0800 – U+FFFF    | <b>1110</b> yyyy | <b>10</b> yyyyxx | <b>10</b> xxxxxx |                  | U+C123 (49443)<br>Binary : <b>1100</b> <b>0001</b> <b>0010</b> <b>0011</b><br><br>Encoded : [ <b>11101100</b> ] [ <b>10000100</b> ]<br>[ <b>10100011</b> ]                                   |
| U+10000 – U+10FFFF | <b>11110</b> zzz | <b>10</b> zzyyyy | <b>10</b> yyyyxx | <b>10</b> xxxxxx | U+0D1B34 (858932)<br><b>0</b> <b>1101</b> <b>0001</b> <b>1011</b> <b>0011</b> <b>0100</b><br><br>Encoded: [ <b>11110011</b> ] [ <b>10010001</b> ]<br>[ <b>10101100</b> ] [ <b>10110100</b> ] |

# UCS

- Universal Character Set
- aka ISO 10646
- An international standard to encompass a truly universal set of characters
- However, UCS != Unicode
  - Some inherent differences
  - E.g. Unicode includes additional rules & specifications
  - For details, do some reading on your own

# Conversions involving decimals

(i.e. non-whole number)

- Decimal to Binary

➤ Decimal: 12.3125

Integer part

|   |    | <i>Remainder</i> |
|---|----|------------------|
| 2 | 12 |                  |
| 2 | 6  | 0 ← <i>LSB</i>   |
| 2 | 3  | 0                |
| 2 | 1  | 1                |
